

Multiway Plug Valve

Five-way to seven-way plug valve

Design Features

Design Characteristics

AZ Multiway plug valve as distributor valve: The vertical outlet downward is used for media inflow or outflow. In each case the connection exists only with one of the horizontal 4-6 outlets. The valve can be manufactured either with or without a positive overlap (positive overlap = overlap-free at switch-over). Actuation occurs manually either via hand lever or gear unit, or automated either electrically or with pneumatic drive + AZ ratchet coupling.
